# ECE 451 Automated Microwave Measurements 

## TRL Calibration

Jose E. Schutt-Aine<br>Electrical \& Computer Engineering<br>University of Illinois<br>jschutt@emlab.uiuc.edu

## Coaxial-Microstrip Transition

## Coaxial-Microstrip Transition

Equivalent Circuit

TDR Plot

With parasitics

No parasitics

## TRL CALIBRATION SCHEME

Want to measure DUT only and need to remove the effect of coax-to-microstrip transitions. Use TRL calibration

## TRL Error Box Modeling

## A model for the different error boxes can be implemented

Error boxes A and B account for the transition parasitics and the electrical lengths of the microstrip.

Make three standards: Thru, Line and Reflect

## Step 1 - THRU Calibration

connect thru

$$
R_{t}=R_{a} R_{b}
$$

## Step 2 - LINE Calibration

connect line (Note: difference in length between thru and line)

## Step 3 - REFLECT Calibration

## connect reflect

## TRL - Measurement Comparison

Measured $\left|\mathrm{S}_{11}\right|$ of Microstrip Unknown Relative to TOUCHSTONE Models

## TRL - Measurement Comparison

Measured Data for Microstrip Unknown
Measured 10/18/94

## TRL Derivation

## TRL Objectives

- Obtain network parameters of error boxes A and B
- Remove their effects in subsequent measurements

## Model for Reflect

2 Measurements

## Model for Thru

$$
\left.\left.\left.\left.\frac{b_{1}^{T}}{a_{1}^{T}}\right|_{a_{2}^{T}=0} \quad \frac{b_{2}^{T}}{a_{1}^{T}}\right|_{a_{2}^{T}=0} \quad \frac{b_{2}^{T}}{a_{2}^{T}}\right|_{a_{1}^{T}=0} \quad \frac{b_{1}^{T}}{a_{2}^{T}}\right|_{a_{1}^{T}=0}
$$

## 4 Measurements

## Model for Line

## 4 Measurements

## Use R (or T) Parameters

Using R parameters (same as T transfer parameters), we can show that if

$$
\begin{gathered}
b_{1}=S_{11} a_{1}+S_{12} a_{2} \\
b_{2}=S_{21} a_{1}+S_{22} a_{2} \\
\binom{b_{1}}{a_{1}}=\frac{1}{S_{21}}\left(\begin{array}{cc}
-\Delta & S_{11} \\
-S_{22} & 1
\end{array}\right)\binom{b_{2}}{a_{2}} \\
\Delta=S_{12} S_{21}-S_{11} S_{22} \\
R=\frac{1}{S_{21}}\left(\begin{array}{cc}
-\Delta & S_{11} \\
-S_{22} & 1
\end{array}\right)\binom{b_{2}}{a_{2}}
\end{gathered}
$$

## TRL Derivation

The measurement matrix $R_{M}$ is just the product of the matrices of the error boxes and the unknown DUT

$$
R_{M}=R_{A} R R_{B}
$$

or

$$
R=R_{A}^{-1} R_{M} R_{B}^{-1}
$$

Let $R_{A}$ be written as

$$
R_{A}=\left[\begin{array}{ll}
r_{11} & r_{12} \\
r_{21} & r_{22}
\end{array}\right]=r_{22}\left[\begin{array}{ll}
a & b \\
c & 1
\end{array}\right]
$$

$R_{B}$ is similarly written as

$$
R_{B}=\left[\begin{array}{ll}
\rho_{11} & \rho_{12} \\
\rho_{21} & \rho_{22}
\end{array}\right]=\rho_{22}\left[\begin{array}{ll}
\alpha & \beta \\
\gamma & 1
\end{array}\right]
$$

The inverse of $R_{A}$ is

$$
R_{A}^{-1}=\frac{1}{r_{22}} \frac{1}{a-b c}\left[\begin{array}{cc}
1 & -b \\
-c & a
\end{array}\right]
$$

## TRL Derivation

And the inverse of $R_{B}$ is

$$
R_{B}^{-1}=\frac{1}{\rho_{22}} \frac{1}{\alpha-\beta \gamma}\left[\begin{array}{cc}
1 & -\beta \\
-\gamma & \alpha
\end{array}\right]
$$

The matrix of the DUT is then found from

$$
R=\frac{1}{r_{22} \rho_{22}} \frac{1}{a \alpha} \frac{1}{1-b \frac{c}{a}} \frac{1}{1-\gamma \frac{\beta}{\alpha}}\left[\begin{array}{cc}
1 & -b \\
-c & a
\end{array}\right] R_{M}\left[\begin{array}{cc}
1 & -\beta \\
-\gamma & \alpha
\end{array}\right]
$$

Note that although there are eight terms in the error boxes, only seven quantities are needed to find $R$. They are $a, b, c, \alpha, \beta$, $\gamma$, and $r_{22} \rho_{22}$
From the measurement of the through and of the line, seven quantities will be found. They are $b, c / a, \beta / \alpha, \gamma, r_{22} \rho_{22}, \alpha a$ and $e^{2 \gamma}$
In addition to the seven quantities, if a were found, the solution would be complete. Let us first find the above seven quantities.

The ideal through has an $R$ matrix which is the $2 \times 2$ unit matrix. The measured $R$ matrix with the through connected will be denoted by $R_{T}$ and is given by

$$
R_{T}=R_{A} R_{B}
$$

Where $R_{\mathrm{A}}$ and $R_{B}$ are the R matrices of the error box A and B respectively. With the line connected, the measured R matrix will be denoted by $R_{D}$ and is equal to

## TRL Derivation

$$
R_{D}=R_{A} R_{L} R_{B}
$$

NOTE: quantities shown in RED are known
where $R_{L}$ is the R matrix of the line
Now $\quad R_{B}=R_{A}^{-1} R_{T}$
so that $\quad R_{D}=R_{A} R_{L} R_{A}^{-1} R_{T}$

$$
R_{D} R_{T}^{-1} R_{A}=R_{A} R_{L}
$$

Define $\quad T=R_{D} R_{T}^{-1} \quad$ Which when substituted into the above equations results in

$$
T R_{A}=R_{A} R_{L}
$$

The matrix $T$ is known from measurements and will be written as

$$
\begin{aligned}
T & =\left[\begin{array}{ll}
t_{11} & t_{12} \\
t_{21} & t_{22}
\end{array}\right] \\
R_{L} & =\left[\begin{array}{cc}
e^{-\gamma l} & 0 \\
0 & e^{+\gamma l}
\end{array}\right], \text { since the line is non-reflecting }
\end{aligned}
$$

## TRL Derivation

$R_{A}$ is unknown and was written as

$$
R_{A}=\left[\begin{array}{ll}
r_{11} & r_{12} \\
r_{21} & r_{22}
\end{array}\right]=r_{22}\left[\begin{array}{ll}
a & b \\
c & 1
\end{array}\right]
$$

$R_{B}$ similarly was written as

$$
R_{B}=\left[\begin{array}{ll}
\rho_{11} & \rho_{12} \\
\rho_{21} & \rho_{22}
\end{array}\right]=\rho_{22}\left[\begin{array}{ll}
\alpha & \beta \\
\gamma & 1
\end{array}\right]
$$

Recalling $T R_{A}=R_{A} R_{L} \quad$ and writing the matrices results in

$$
\left[\begin{array}{ll}
t_{11} & t_{12} \\
t_{21} & t_{22}
\end{array}\right]\left[\begin{array}{ll}
a & b \\
c & 1
\end{array}\right]=\left[\begin{array}{ll}
a & b \\
c & 1
\end{array}\right]\left[\begin{array}{cc}
e^{-\gamma l} & 0 \\
0 & e^{+\gamma l}
\end{array}\right]
$$

Next, writing out the four equations gives:

## TRL Derivation

$$
\begin{aligned}
& t_{11} a+t_{12} c=a e^{-\gamma l} \\
& t_{21} a+t_{22} c=c e^{-\gamma l} \\
& t_{11} b+t_{12}=b e^{+\gamma l} \\
& t_{21} b+t_{22}=b e^{+\gamma l}
\end{aligned}
$$

Dividing the first of the above equation by the second results in

$$
\begin{aligned}
& \frac{t_{11} a+t_{12} c}{t_{21} a+t_{22} c}=\frac{c}{a}=\frac{t_{11} \frac{a}{c}+t_{12}}{t_{21} \frac{a}{c}+t_{22}} \quad \text { which gives a quadratic equation for } a / c \\
& t_{21}\left(\frac{a}{c}\right)^{2}+\left(t_{22}-t_{11}\right) \frac{a}{c}-t_{12}=0
\end{aligned}
$$

Dividing the third equation in the group by the fourth results in

## TRL Derivation

$$
\begin{aligned}
& \frac{t_{11} b+t_{12}}{t_{21} b+t_{22}}=b \quad \text { which gives the analogous quadratic equation for } \mathrm{b} \text { as } \\
& t_{21} b^{2}+\left(t_{22}-t_{11}\right) b-t_{12}=0
\end{aligned}
$$

Dividing the fourth equation in the group by the second results in

$$
e^{2 \gamma L}=c \frac{t_{21} b+t_{22}}{t_{21} a+t_{22} c}=\frac{t_{21} b+t_{22}}{t_{21} \frac{a}{c}+t_{22}}
$$

Since $e^{2 r L}$ is not equal to $1, b$ and $c / a$ are distinct roots of the quadratic equation. The following discussion will enable the choice of the root. Now $b=r_{12} / r_{22}=S_{11}$ and

$$
\frac{a}{c}=\frac{r_{11}}{r_{21}}=S_{11}-\frac{S_{12} S_{21}}{S_{22}}
$$

## TRL Derivation

For a well designed transition between coax and the non-coax $\left|S_{22}\right|,\left|S_{11}\right| \ll 1$ which yields $|b| \ll 1$ and $|a / c| \gg 1$. Therefore,

$$
|b| \ll\left|\frac{a}{c}\right| \quad \text { which determines the choice of the root }
$$

Recalling

$$
T R_{A}=R_{A} R_{L}
$$

$$
(\operatorname{det} T)\left(\operatorname{det} R_{A}\right)=\left(\operatorname{det} R_{A}\right)\left(\operatorname{det} R_{L}\right)
$$

or

$$
(\operatorname{det} T)=\left(\operatorname{det} R_{L}\right)=1
$$

so that

$$
t_{11} t_{22}-t_{12} t_{21}=1
$$

which implies that there are only three independent $T_{i j}$. Then there are only three independent results, e.g. $b, a / c$, and $e^{2 \mu}$.

## TRL Derivation

Now let us find four more quantities

$$
r_{22} \rho_{22}\left[\begin{array}{ll}
a & b \\
c & 1
\end{array}\right]\left[\begin{array}{ll}
\alpha & \beta \\
\gamma & 1
\end{array}\right]=R_{A} R_{B}=R_{T}=g\left[\begin{array}{ll}
d & e \\
f & 1
\end{array}\right]
$$

Now

$$
\left[\begin{array}{ll}
a & b \\
c & 1
\end{array}\right]^{-1}=\frac{1}{a-b c}\left[\begin{array}{cc}
1 & -b \\
-c & a
\end{array}\right]
$$

So that

$$
r_{22} \rho_{22}\left[\begin{array}{cc}
\alpha & \beta \\
\gamma & 1
\end{array}\right]=\frac{g}{a-b c}\left[\begin{array}{cc}
1 & -b \\
-c & a
\end{array}\right]\left[\begin{array}{ll}
d & e \\
f & 1
\end{array}\right]
$$

or

$$
r_{22} \rho_{22}\left[\begin{array}{cc}
\alpha & \beta \\
\gamma & 1
\end{array}\right]=\frac{g}{a-b c}\left[\begin{array}{cc}
d-b f & e-b \\
a f-c d & a-c e
\end{array}\right]
$$

## TRL Derivation

from which we can extract

$$
r_{22} \rho_{22}=g \frac{a-c e}{a-b c}=g \frac{1-e \frac{c}{a}}{1-b \frac{c}{a}}
$$

We also have

$$
\left[\begin{array}{cc}
\alpha & \beta \\
\gamma & 1
\end{array}\right]=\frac{1}{a-c e}\left[\begin{array}{cc}
d-b f & e-b \\
a f-c d & a-c e
\end{array}\right]
$$

from which we obtain

$$
\gamma=\frac{f-\frac{c}{a} d}{1-\frac{c}{a} e}
$$

and

$$
\frac{\beta}{\alpha}=\frac{e-b}{d-b f}
$$

## TRL Derivation

and

$$
\alpha a=\frac{d-b f}{1-\frac{c}{a} e}
$$

The additional four quantities found are $\beta / \alpha, \gamma, r_{22} \rho_{22}$ and $\alpha$ a. To complete the solution, one needs to find $a$. Let the reflection measurement through error box $A$ be $w_{1}$. Then

$$
\begin{aligned}
& w_{1}=\frac{a \Gamma_{R}+b}{c \Gamma_{R}+1} \quad \text { which may be solved for } a \text { in terms of the known } b \text { and } a / c \text { as } \\
& a=\frac{w_{1}-b}{\Gamma_{R}\left(1-w_{1} \frac{c}{a}\right)}
\end{aligned}
$$

We need a method to determine a. Use the measurement for the reflect from through the error box $B$. Let $w_{2}$ denote the measurement

$$
w_{2}=S_{22}+\frac{S_{12} S_{21} \Gamma_{R}}{1-S_{11} \Gamma_{R}}=\frac{S_{22}-\Delta \Gamma_{R}}{1-S_{11} \Gamma_{R}}
$$

## TRL Derivation

$$
w_{2}=\frac{-\frac{\rho_{21}}{\rho_{22}}+\frac{\rho_{11}}{\rho_{22}} \Gamma_{R}}{1-\frac{\rho_{12}}{\rho_{22}} \Gamma_{R}}
$$

or

$$
w_{2}=-\frac{\alpha \Gamma_{R}-\gamma}{\beta \Gamma_{R}-1}
$$

$\alpha$ may be found in terms of $\gamma$ and $\beta / \alpha$ as

$$
\begin{array}{r}
\alpha=\frac{w_{2}+\gamma}{\Gamma_{R}\left(1+w_{2} \frac{\beta}{\alpha}\right)} \\
\text { Recall } a=\frac{w_{1}-b}{\Gamma_{R}\left(1-w_{1} \frac{c}{a}\right)}
\end{array}
$$

## TRL Derivation

so that

$$
\frac{a}{\alpha}=\frac{w_{1}-b}{w_{2}+\gamma} \times \frac{1+w_{2} \frac{\beta}{\alpha}}{1-w_{1} \frac{c}{a}}
$$

From earlier $\quad \alpha a=\frac{d-b f}{1-\frac{c}{a} e}$
so that

$$
a^{2}=\frac{w_{1}-b}{w_{2}+\gamma} \frac{1+w_{2} \frac{\beta}{\alpha}}{1-w_{1} \frac{c}{a}} \frac{d-b f}{1-\frac{c}{a} e}
$$

or

$$
a= \pm\left(\frac{w_{1}-b}{w_{2}+\gamma} \times \frac{1+w_{2} \frac{\beta}{\alpha}}{1-w_{1} \frac{c}{a}} \times \frac{d-b f}{1-\frac{c}{a} e}\right)^{\frac{1}{2}}
$$

which determines $a$ to within $a \pm$ sign.

## TRL Derivation

$$
\Gamma_{R}=\frac{w_{1}-b}{a\left(1-w_{1} \frac{c}{a}\right)}
$$

So if $\Gamma_{R}$ is known to within $\pm$ then a may be determined as well. Calibration is complete and we can now proceed to the measurement of the DUT.

From earlier, the matrix of the DUT is found from

$$
R=\frac{1}{r_{22} \rho_{22}} \frac{1}{a \alpha} \frac{1}{1-b \frac{c}{a}} \frac{1}{1-\gamma \frac{\beta}{\alpha}}\left[\begin{array}{cc}
1 & -b \\
-c & a
\end{array}\right] R_{M}\left[\begin{array}{cc}
1 & -\beta \\
-\gamma & \alpha
\end{array}\right]
$$

in which all the terms have now been determined.

## TRL Application

## TRL Application

## TRL Application

Example measurement (a) return loss of microstrip transmission line (b) insertion loss of a microstrip transmission line (1) calibrated at the coaxial ports of the fixture (2) calibrated in-fixture with TRL.

## TRL Application

Microstrip PC board as a test fixture including separate transmission lines as the THRU and LINE, an open circuit, and a test line for insertion of a test device.

## TRL Application

Example measurement of a linear FET on the microstrip PC board compared to measurement in a de-embedded test fixture (Agilent 85041A). (1) de-embedded measurement (2) TRL calibration using PC board standards.

| REFLECT | Reflection coefficient G magnitude (optimally 1.0 ) need not be known Phase of G must be known within $\pm 1 / 4$ wavelength ${ }^{1}$ <br> Must be the same G on both ports <br> May be used to set the reference plane if the phase response of the REFLECT is well-known and specified |
| :---: | :---: |
| $\begin{gathered} \text { Zero } \\ \text { Length THRU } \end{gathered}$ | $\mathrm{S}_{21}$ and $\mathrm{S}_{12}$ are defined equal to 1 at 0 degrees (typically used to set the reference plane) $\mathrm{S}_{11}$ and $\mathrm{S}_{22}$ are defined equal to zero ${ }^{2}$ |
| Non-Zero Length THRU | Characteristic impedance $Z_{0}$ of the THRU and LINE must be the same ${ }^{4.5}$ <br> Attenuation of the THRU need not be known <br> Insertion phase or electrical length must be specified if the THRU is used to set the reference plane ${ }^{3}$ |
| LINE | $Z_{0}$ of the LINE establishes the reference impedance after error correction is applied ${ }^{5}$ <br> Insertion phase of the LINE must never be the same as that of the THRU (zero or non-zero length) ${ }^{6}$ <br> Optimal LINE length is $1 / 4$ wavelength or 90 degrees relative to the THRU at the center frequency ${ }^{7}$ <br> Useable bandwidth of a single THRU/LINE pair is $8: 1$ (frequency span/start frequency) <br> Multiple THRU/LINE pairs ( $Z_{0}$ assumed identical) can be used to extend the bandwidth to the extent transmission <br> lines are realizable <br> Attenuation of the LINE need not be known insertion phase or electrical length need only be specified within $1 / 4$ wavelength |
| MATCH | Assumes same $Z_{0}$ on both ports <br> $Z_{0}$ of the MATCH standards establishes the reference impedance after error correction is applied No frequency range limitations <br> (MATCH may be used instead of LOWBAND REFLECTION cal steps) |
|  | 1. The phase response need only be specified within a $1 / 4$ wavelength $\pm 90$ degrees either way. During computation of the error model, the root choice in the solution of a quadratic equation is made based on the reflection data. An error in definition would show up as a 180 -degree errror in the measured phase. <br> 2. A zero-length THRU has no loss and has no characteristic impedance. <br> 3. If a nonzero-length THRU is used but specified to have zero delay, the reference plane will be established in the middle of the THRU. <br> 4. When the $Z_{0}$ of the THRU and LINE are not the same, the average impedance is used. <br> 5. $\mathrm{S}_{11}$ and $\mathrm{S}_{22}$ of the LINE are also defined to be zero. With this assumption, the system impedance is set to the characteristic impedance of the LINE. If the $\mathrm{Z}_{0}$ is known but not the desired value, the impedance of the LINE can be specified when defining the calibration standards. <br> 6. The insertion phase difference between the THRU and LINE must be between ( 20 and 160 degrees) $\pm n \times 180$ degrees. Measurement uncertainty will increase significantly when the insertion phase nears 0 or an integer multiple of 180 degrees. <br> 7. The optimal length of a LINE is $1 / 4$ wavelength or 90 degrees of insertion phase in the middle or the geometric mean of the desired frequency span. |
